

Lots of science language and our sense of sight, touch and smell this week to observe the changes to the jelly cubes. First we had to pull and stretch the cubes to break it up and then we watch it dissolve as we stirred in the hot water. We had to leave it over night and noticed how it changed from being a liquid into a solid form or compound. We took it outside for some smelly jelly fun as we tipped it out and used our finger to squash and squeeze. It smelled just like our strawberries that we had for snack.
